# Package 'Capr'

# February 18, 2025

Version 2.0.9
Description Provides a programming language for defining cohort definitions in R to use in studies for Observational
Health Data Sciences and Informatics (OHDSI). The functions in 'Capr' allow for the programmatic creation of
OHDSI concept sets and cohorts that can be serialized to 'OHDSI' compatible 'json' files or to 'OHDSI-SQL'.
'Capr' functions can be used to create, save, and load component parts to a cohort definition allowing
R programmers to easily reuse cohort logic. 'Capr' provides tools to create a large number of OHDSI cohorts
while also helping bridge the gap between human readable descriptions of clinical phenotypes

==	FUnction checks if two concept set class objects are equivalent

# Description

FUnction checks if two concept set class objects are equivalent

# Usage

```
## S4 method for signature 'ConceptSet,ConceptSet'
e1 == e2
```

# Arguments

e1, e2 a ConceptSet Class object

age

Function to create age attribute

# Description

Function to create age attribute

# Usage

age(op)

# Arguments

ор

an opAttribute object that is either numeric or integer that defines the logical operation used to determine eligible patient age

#### Value

An age attribute that can be used in a cohort definition

```
as.data.frame,ConceptSet-method
```

Coerce a concept set expression to a dataframe

# Description

Coerce a concept set expression to a dataframe

# Usage

```
## S4 method for signature 'ConceptSet'
as.data.frame(x)
```

# **Arguments**

Х

A Caper Concept Set

#### Value

A tibble (dataframe) with columns: concept\_id, includeDescendants, isExcluded, includeMapped.

as.json

Coerce Capr object to json

# Description

Coerce Capr object to json

# Usage

```
as.json(x, pretty = TRUE, ...)
## S4 method for signature 'ConceptSet'
as.json(x, pretty = TRUE, ...)
## S4 method for signature 'Cohort'
as.json(x, pretty = TRUE, ...)
```

# **Arguments**

```
x the capr object
pretty a toggle to make the json look nice, part of jsonlite
additional arguments passes to jsonlite::toJSON
```

6 atMost

atLeast

Function to enumerate an minimal count of occurrences

### **Description**

Function to enumerate an minimal count of occurrences

### Usage

```
atLeast(x, query, aperture = duringInterval(eventStarts(-Inf, Inf)))
```

### **Arguments**

x the integer counting the number of occurrences

query a query object that provides context to the clinical event of interest

aperture an eventAperture object that shows the temporal span where the event is to be

observed relative to the index event

#### Value

A criteria that can be used in a cohort definition specifying satisfaction of at least x instances of a query

atMost

Function to enumerate a maximum count of occurrences

# Description

Function to enumerate a maximum count of occurrences

#### Usage

```
atMost(x, query, aperture = duringInterval(eventStarts(-Inf, Inf)))
```

#### **Arguments**

x the integer counting the number of occurrences

query a query object that provides context to the clinical event of interest

aperture an eventAperture object that shows the temporal span where the event is to be

observed relative to the index event

#### Value

A criteria that can be used in a cohort definition specifying satisfaction of at most x instances of a query

attrition 7

attrition

Create a cohort attrition object

## **Description**

Create a cohort attrition object

#### Usage

```
attrition(..., expressionLimit = c("First", "All", "Last"))
```

### **Arguments**

```
\begin{tabular}{ll} $\dots$ & Capr groups \\ expression Limit \\ \end{tabular}
```

how to limit initial events per person either First, All, or Last

#### Value

A cohort attrition object that can be used in a cohort definition

bt

Between operator

### **Description**

function that builds an opAttribute based on between logic

### Usage

```
bt(x, y)
## S4 method for signature 'integer'
bt(x, y)
## S4 method for signature 'numeric'
bt(x, y)
## S4 method for signature 'Date'
bt(x, y)
```

# **Arguments**

x the left side bound of the between logic This can either be an integer, numeric, or Date data type. Different data types will return the appropriate opAttribute type

y the right side bound of the between logic. This can either be an integer, numeric, or Date data type. Different data types will return the appropriate opAttribute type

8 cohort

CensoringCriteria-class

An S4 class identifying a censoring criteria for the cohort

# Description

The censoring criteria specifies events where the person exits the cohort. These events are based on a query class object and users can specify multiple queries in the censoring criteria.

#### **Slots**

criteria a list of Capr query class objects that specify the events that would lead a person to exit the cohort.

censoringEvents

Constructor for a set of censoring events

# Description

Constructor for a set of censoring events

# Usage

```
censoringEvents(...)
```

# Arguments

... a list of Capr query objects that are used as censoring events

# Value

a censoring criteria S4 object used to define the censoring events of the cohort definition

cohort

Function that creates a cohort object

# Description

Function that creates a cohort object

# Usage

```
cohort(entry, attrition = NULL, exit = NULL, era = NULL)
```

compile 9

### **Arguments**

entry the index event of the cohort

attrition rules that restrict the cohort further, developing attrition

exit the event where the person exits the cohort

era Cohort era (collapse) logic created with the 'cohortEra' function

### Value

an S4 Cohort class object describing the cohort definiton

compile

Compile a Capr object to json

### **Description**

Compile a Capr object to json

#### Usage

```
compile(object, ...)
```

### **Arguments**

object A Capr object such as a cohort, list of cohorts, or concept set.

... Arguments passed on to jsonlite::toJSON. e.g. 'pretty = TRUE' for nicely for-

matted json.

# Value

The json representation of the Capr object

```
compile, Cohort-method Compile a Capr cohort to json
```

# Description

```
Compile a Capr cohort to json
Compile a Capr Concept Set to json
```

#### Usage

```
## S4 method for signature 'Cohort'
compile(object, ...)
## S4 method for signature 'ConceptSet'
compile(object, ...)
```

10 conceptAttribute-class

#### **Arguments**

object A Capr Concept Set created with 'cs'

... Arguments passed on to jsonlite::toJSON. e.g. 'pretty = TRUE' for nicely for-

matted json.

#### Value

The json representation of Capr cohorts The json representation of Capr cohorts

#### **Examples**

```
ch <- cohort(conditionOccurrence(cs(1,2, name = "concepts")))
compile(ch)</pre>
```

Concept-class

An S4 class for a single OMOP Concept

### **Description**

A concept class contains all the information about the concept from the OMOP voabulary.

#### **Slots**

```
concept_id the OMOP/OHDSI concept ID

concept_name the name of the concept
standard_concept whether the concept is standard 'S', classification 'C', or non-standard NA
standard_concept_caption Whether the concept is standard full phrase
invalid_reason Whether the concept is invalid single letter
invalid_reason_caption whether the concept is invalid standard phrase
concept_code The original code of the concept from its vocabulary
domain_id The domain of the concept (e.g. Drug, Condition, Procedure, etc)
vocabulary_id the name of the vocabulary
concept_class_id type of concept class
```

```
conceptAttribute-class
```

An S4 class for a concept attribute

#### **Description**

An S4 class for a concept attribute

#### **Slots**

```
name the name of the attribute conceptSet a list representing the concepts for the attribute
```

ConceptSet-class 11

ConceptSet-class An S4 class for ConceptSetExpresion

## **Description**

A class for the concept set expressions bundles multiple concepts with mapping

#### **Slots**

id an id for the concept set expression to identify within a component

Name the name of the concept set expression

Expression a list containing expressions. expressions include multiple conceptSetItem objects

ConceptSetItem-class An S4 class for ConceptSetItem

### **Description**

A class that provides information on the mapping of the concept

#### **Slots**

Concept a concept class object
isExcluded toggle if want to exclude the concept
includeDescendants toggle if want to include descendants
includeMapped toggle if want to include map

 ${\tt conditionEra}$ 

Query the condition era domain

## **Description**

Query the condition era domain

# Usage

```
conditionEra(conceptSet, ...)
```

# Arguments

conceptSet A condition concept set
... optional attributes

#### Value

A Capr Query

12 conditionType

conditionOccurrence

Query the condition domain

# Description

Query the condition domain

# Usage

```
conditionOccurrence(conceptSet, ...)
```

# **Arguments**

conceptSet A condition concept set
... optional attributes

#### Value

A Capr Query

 ${\tt conditionType}$ 

Add a condition type attribute to determine the provenance of the record

# Description

Add a condition type attribute to determine the provenance of the record

# Usage

```
conditionType(ids, connection, vocabularyDatabaseSchema)
```

# **Arguments**

ids the concept ids for the attribute

connection a connection to an OMOP dbms to get vocab info about the concept

vocabularyDatabaseSchema

the database schema for the vocabularies

# Value

An attribute that can be used in a query function

continuousObservation 13

continuousObservation A function to construct the observationWindow

# Description

A function to construct the observationWindow

# Usage

```
continuousObservation(priorDays = 0L, postDays = 0L)
```

### **Arguments**

priorDays	minimum number of observation days prior to the cohort index. Default 0 days
postDays	minimum number of observation days post cohort index. Default 0 days

# Value

An observation window that can be used in a Capr cohort definition

Criteria-class An S4 for a criteria

# Description

a criteria is a temporal observation of a clinical event relative to the index event

#### **Slots**

occurrence an occurrence object specifying how many events must occur to consider the event as part of the cohort definition

query a query object that provides context to the clinical event of interest

aperture an eventAperture object that shows the temporal span where the event is to be observed relative to the index event

14 cs

cs

Create a concept set

### **Description**

```
cs is used to create concept set expressions.
```

'exclude' is meant to be used inside 'cs' when creating a new concept set.

'mapped' is meant to be used inside 'cs' when creating a new concept set.

'descendants' is meant to be used inside 'cs' when creating a new concept set.

#### Usage

```
cs(..., name, id = NULL)
exclude(...)
mapped(...)
descendants(...)
```

#### **Arguments**

One or more numeric vectors that can be coerced to integers, or Calls to helper functions "exclude", "descendants", or "mapped".
 A name for the concept set
 An id for the concept set

# Value

A Capr Concept Set Object
A list of Capr concepts
A list of Capr concepts
A list of Capr concepts

### **Functions**

- exclude(): exclude concepts
- mapped(): Include mapped concepts
- descendants(): Include descendants

# Examples

```
cs(1, 2, name = "concepts")
cs(1, c(10, 11, 2), name = "concepts")
cs(1, seq(2, 10, 2), name = "concepts")
cs(1, 2, 3, exclude(4, 5), name = "concepts")
cs(1, 2, 3, exclude(4, 5), mapped(6, 7), name = "concepts")
cs(1, 2, 3, exclude(4, 5), mapped(6, 7), descendants(8, 9), name = "concepts")
cs(descendants(1, 2, 3), exclude(descendants(8, 9)), name = "concepts")
```

dateAdjustment 15

dateAdjustment

Function to create age attribute

### Description

Function to create age attribute

# Usage

```
dateAdjustment(
  startWith = "START_DATE",
  startOffset = 0L,
  endWith = "END_DATE",
  endOffset = 0L
)
```

# **Arguments**

startWith character string either START\_DATE or END\_DATE

 ${\tt startOffset}$  an integer value, default 0

endWith character string either START\_DATE or END\_DATE

endOffset an integer value, default 0

### Value

A dateAdjustment attribute class that can be used with a query

dateAdjustmentAttribute-class

An S4 class for a date adjustment attribute

# Description

An S4 class for a date adjustment attribute

### **Slots**

```
name the name of the attribute startWith character string either START_DATE or END_DATE startOffset an integer value, default 0 endWith character string either START_DATE or END_DATE endOffset an integer value, default 0
```

16 death

daysOfSupply

Function to create days supply attribute

# Description

This function is used only for a drug query. days supply is a column in the drug exposure table of the cdm. This attribute allows a subquery to find drugs that satisfy certain values determined by the op logic.

### Usage

```
daysOfSupply(op)
```

### **Arguments**

op

an opAttribute object that is either numeric or integer that defines the logical operation used to determine eligible number of days of supply

#### Value

An attribute that can be used in a cohort definition

death

Query the condition era domain

# Description

Query the condition era domain

### Usage

```
death(conceptSet = NULL, ...)
```

## **Arguments**

```
conceptSet A condition concept set
... optional attributes
```

### Value

A Capr Query

deviceExposure 17

deviceExposure

Query the drug domain

# Description

Query the drug domain

# Usage

```
deviceExposure(conceptSet, ...)
```

# **Arguments**

```
conceptSet A drug concept set
... optional attributes
```

#### Value

A Capr Query

drugEra

Query the drug era domain

# Description

Query the drug era domain

# Usage

```
drugEra(conceptSet, ...)
```

# Arguments

```
conceptSet A drug ingredient concept set
... optional attributes
```

# Value

A Capr Query

18 drugExposure

drugExit

Function to create an exit based on exit based on the end of a continuous drug exposure

# Description

Function to create an exit based on exit based on the end of a continuous drug exposure

### Usage

```
drugExit(
  conceptSet,
  persistenceWindow = 0L,
  surveillanceWindow = 0L,
  daysSupplyOverride = NULL
)
```

# **Arguments**

 ${\tt conceptSet} \qquad {\tt the \ concept \ set \ of \ the \ drug \ exposure \ used \ to \ identify \ the \ exit} \\ {\tt persistenceWindow}$ 

allow for a maximum of days between exposure records when inferring the era of persistence exposure

surveillanceWindow

add days to the end of the era of persistence exposure as an additional period of surveillance prior to cohort exit

daysSupplyOverride

force drug exposure days supply to a set number of days

#### Value

an S4 DrugExposueExit class which defines the cohort exit by end of drug exposure

drugExposure

Query the drug domain

### **Description**

Query the drug domain

#### Usage

```
drugExposure(conceptSet, ...)
```

#### **Arguments**

```
conceptSet A drug concept set
... optional attributes
```

#### Value

A Capr Query

DrugExposureExit-class

An S4 class for a cohort exit based on continuous exposure persistence.

#### **Description**

Specify a concept set that contains one or more drugs. A drug era will be derived from all drug exposure events for any of the drugs within the specified concept set, using the specified persistence window as a maximum allowable gap in days between successive exposure events and adding a specified surveillance window to the final exposure event. If no exposure event end date is provided, then an exposure event end date is inferred to be event start date + days supply in cases when days supply is available or event start date + 1 day otherwise. This event persistence assures that the cohort end date will be no greater than the drug era end date.

#### **Slots**

conceptSet the concept set of the drug exposure used to identify the exit

persistenceWindow allow for a maximum of days between exposure records when inferring the era of persistence exposure

surveillanceWindow add days to the end of the era of persistence exposure as an additional period of surveillance prior to cohort exit

daysSupplyOverride force drug exposure days supply to a set number of days

count an integer specifying the number of occurrences for a criteria

drugQuantity

Function to create quantity attribute

# Description

This function is used only for a drug query. quantity is a column in the drug exposure table of the cdm. This attribute allows a subquery to find drugs that satisfy certain values determined by the op logic.

### Usage

drugQuantity(op)

#### **Arguments**

ор

an opAttribute object that is either numeric or integer that defines the logical operation used to determine eligible quantity

#### Value

An attribute that can be used in a cohort definition

20 drugType

drugRefills

Function to create refills attribute

### **Description**

This function is used only for a drug query. refills is a column in the drug exposure table of the cdm. This attribute allows a subquery to find drugs that satisfy certain values determined by the op logic.

#### Usage

```
drugRefills(op)
```

#### **Arguments**

ор

an opAttribute object that is either numeric or integer that defines the logical operation used to determine eligible number of refills

### Value

An attribute that can be used in a cohort definition

drugType

Add a drug type attribute to determine the provenance of the record

### **Description**

Add a drug type attribute to determine the provenance of the record

#### Usage

```
{\tt drugType(ids,\ connection,\ vocabularyDatabaseSchema)}
```

# **Arguments**

ids the concept ids for the attribute

connection a connection to an OMOP dbms to get vocab info about the concept

vocabularyDatabaseSchema

the database schema for the vocabularies

# Value

An attribute that can be used in a query function

duringInterval 21

duringInterval	Function that creates an eventAperture an opening where an event can occur relative to the index event

### **Description**

Function that creates an eventAperture an opening where an event can occur relative to the index event

### Usage

```
duringInterval(
   startWindow,
   endWindow = NULL,
   restrictVisit = FALSE,
   ignoreObservationPeriod = FALSE
)
```

### **Arguments**

startWindow the starting window where an event can occur

endWindow the end window of where an event can occur. This parameter is optional restrictVisit a logical toggle specifying whether the event should occur on the same visit ignoreObservationPeriod

reobservacioni er iou

a logical toggle specifying whether we can consider events outside the observa-

tion period

#### Value

An event aperture that can be used in a Capr cohort definition

endDate	Function that creates a end date attribute

# Description

Function that creates a end date attribute

### Usage

```
endDate(op, type = "occurrence")
```

# **Arguments**

op an opAttribute object must be a date that defines the logical operation used to

determine eligible end dates

type specify the type of date to use either occurrence or era. default as occurrence

#### Value

An attribute that can be used in a cohort definition

22 entry

Endpoint-class

An S4 class for an Endpoint

### **Description**

this determines the time in days relative to an index either before or after

#### **Slots**

days either a character string all or an integer for the number of days coeff a character string either before or after

entry

Create a cohort entry criteria

### **Description**

Create a cohort entry criteria

# Usage

```
entry(
    ...,
    observationWindow = continuousObservation(0L, 0L),
    primaryCriteriaLimit = c("First", "All", "Last"),
    additionalCriteria = NULL,
    qualifiedLimit = c("First", "All", "Last")
)
```

### **Arguments**

# Value

A cohort entry Capr object

eq 23

eq

Equal to operator

### **Description**

function that builds an opAttribute based on equal to logic

#### Usage

```
eq(x)
## S4 method for signature 'integer'
eq(x)
## S4 method for signature 'numeric'
eq(x)
## S4 method for signature 'Date'
eq(x)
```

#### **Arguments**

Х

the value to used as a bound in the op logic. This can either be an integer, numeric, or Date data type. Different data types will return the appropriate opAttribute type

era

Create a Cohort Era class object

### **Description**

The Cohort Era depicts the time span of the cohort. The Censor Window includes the date window for which we register events. The Collapse Settings identify the era padding between events before exiting a cohort.

#### Usage

```
era(eraDays = 0L, studyStartDate = NULL, studyEndDate = NULL)
```

#### **Arguments**

```
eraDays a numeric that specifies the number of days for the era padding studyStartDate a date string that specifies the starting date of registration studyEndDate a date string that specifies the end date of registration
```

#### Value

a S4 CohortEra class object defining the eras of the cohort definition

24 eventEnds

EventAperture-class An S4 class for Aperture

### **Description**

The aperture class provides context to when the criteria must be observed in a person timeline to pretain to the expression

#### **Slots**

```
startWindow a EventWindow class object identifying the start window
endWindow a EventWindow class object ifentifying the end window (optional)
restrictVisit a logic toggle where TRUE restricts to the same visit
ignoreObservationPeriod a logic toggle where TRUE allows events outside the observation period
```

 ${\tt eventEnds}$ 

Function creates an event window where the event ends

# **Description**

Function creates an event window where the event ends

# Usage

```
eventEnds(a, b, index = c("startDate", "endDate"))
```

#### **Arguments**

a the left side of the event windowb the right side of the event window

index specifying what part of the index we start looking for events either at the index

start date or index enddate

### Value

An event window that can be used in a Capr cohort definition

eventStarts 25

eventStarts	Function creates an event window where the event starts

### **Description**

Function creates an event window where the event starts

### Usage

```
eventStarts(a, b, index = c("startDate", "endDate"))
```

# **Arguments**

а	the left side of the event window
b	the right side of the event window
index	specifying what part of the index we start looking for events either at the

specifying what part of the index we start looking for events either at the index start date or index enddate

# Value

An event window that can be used in a Capr cohort definition

# Description

A window class provides details on the end points of the timeline

# **Slots**

event a character string either start or end. Identifies the point of reference for the window start an endpoint object containing the days and coefficient for the start of the window end an endpoint object containing the days and coefficient for the end of the window index A character string either start or end. Identifies where the index is relative to the window

26 exit

exactly	Function to enumerate an exact count of occurrences	

# Description

Function to enumerate an exact count of occurrences

# Usage

```
exactly(x, query, aperture = duringInterval(eventStarts(-Inf, Inf)))
```

### **Arguments**

x the integer counting the number of occurrences

query a query object that provides context to the clinical event of interest

aperture an eventAperture object that shows the temporal span where the event is to be

observed relative to the index event

### Value

A criteria that can be used in a cohort definition specifying satisfaction of exactly x instances of a query

exit

Function that creates a cohort exit object

#### **Description**

Function that creates a cohort exit object

### Usage

```
exit(endStrategy, censor = NULL)
```

# Arguments

endStrategy the endStrategy object to specify for the exit censor the censoring criteria to specify for the exit

### Value

A cohort exit object that can be used in a cohort definition

firstOccurrence 27

٠.		<b>^</b>		
T 1	rsti	ורכו	ırre	ence

Add first occurrence attribute

### **Description**

Add first occurrence attribute

### Usage

firstOccurrence()

#### Value

An attribute that can be used in a query function

FixedDurationExit-class

An S4 class for a cohort exit based on fixed duration persistence.

#### **Description**

The event end date is derived from adding a number of days to the event's start or end date. If an offset is added to the event's start date, all cohort episodes will have the same fixed duration (subject to further censoring). If an offset is added to the event's end date, persons in the cohort may have varying cohort duration times due to the varying event durations (such as eras of persistent drug exposure or visit length of stay). This event persistence assures that the cohort end date will be no greater than the selected index event date, plus the days offset.

#### Slots

index specification of event date to offset

offsetDays an integer specifying the number of days to offset from the event date

fixedExit

Function to create an exit based on exit based on the end of a continuous drug exposure

### **Description**

Function to create an exit based on exit based on the end of a continuous drug exposure

# Usage

```
fixedExit(index = c("startDate", "endDate"), offsetDays)
```

#### **Arguments**

index specification of event date to offset. Can be either startDate or endDate

offsetDays an number specifying the days to offset from the event date. Will coerce to an

integer

#### Value

a fixed Duration exit S4 object used to define the cohort exit as the end of a specified time

getConceptSetCall

Create the Capr code to build a concept set

### **Description**

Create the Capr code to build a concept set

# Usage

```
getConceptSetCall(x, name = x@Name)
```

# Arguments

x A concept set

name the name of the concept set

#### Value

The Capr code required to build the concept set

getConceptSetDetails Fill in Concept Set details using a vocab

### **Description**

Concept sets created in R using the 'cs' function do not contain details like "CONCEPT\_NAME", "DOMAIN\_ID", etc. If an OMOP CDM vocabulary is available then these details can be filled in by the the 'getConceptSetDetails' function.

#### Usage

```
getConceptSetDetails(x, con, vocabularyDatabaseSchema = NULL)
```

#### Arguments

x A concept set created by 'cs'

 $\begin{array}{ccc} \text{con} & \text{A connection to an OMOP CDM database} \\ \text{vocabularyDatabaseSchema} \end{array}$ 

Schema name where your OMOP vocabulary format resides. Note that for SQL Server, this should include both the database and schema name, for example 'vocabulary.dbo'.

Group-class 29

#### Value

A modified version of the input concept set with concept details filled in.

#### **Examples**

```
## Not run:
# create a concept set
vocabularyDatabaseSchema = "cdm5"
anemia <- cs(descendants(439777,4013073,4013074), name = "anemia")
# fill in the details from an OMOP CDM
library(DatabaseConnector)
con <- connect(dbms = "postgresq1", user = "postgres", password = "", server = "localhost/cdm")
anemia <- getConceptSetDetails(condition_anemia, con, vocabularyDatabaseSchema = "cdm5")
## End(Not run)</pre>
```

Group-class

An S4 class for a group

# Description

a group is the combination of multiple criteria or sub groups

#### **Slots**

occurrence an occurrence object specifying how many events must occur to consider the event as part of the cohort definition

critera a list of criteria that are grouped together

group a list of sub-groups to consider

gt

Greater than operator

# Description

function that builds an opAttribute based on greater than logic

## Usage

```
gt(x)
## S4 method for signature 'integer'
gt(x)
## S4 method for signature 'numeric'
gt(x)
## S4 method for signature 'Date'
gt(x)
```

30 logicAttribute-class

# **Arguments**

Х

the value to used as a bound in the op logic. This can either be an integer, numeric, or Date data type. Different data types will return the appropriate opAttribute type

gte

Greater than or equal to operator

# Description

function that builds an opAttribute based on greater than or equal to logic

# Usage

```
gte(x)
## S4 method for signature 'integer'
gte(x)
## S4 method for signature 'numeric'
gte(x)
## S4 method for signature 'Date'
gte(x)
```

# Arguments

Χ

the value to used as a bound in the op logic. This can either be an integer, numeric, or Date data type. Different data types will return the appropriate opAttribute type

logicAttribute-class An S4 class for a logical attribute

# Description

with a logic attribute if it is specified than we assume it is true

#### Slots

name the name of the attribute

*It* 31

lt

Less than operator

### **Description**

function that builds an opAttribute based on less than logic

# Usage

```
lt(x)
## S4 method for signature 'integer'
lt(x)
## S4 method for signature 'numeric'
lt(x)
## S4 method for signature 'Date'
lt(x)
```

### **Arguments**

Х

the value to used as a bound in the op logic. This can either be an integer, numeric, or Date data type. Different data types will return the appropriate opAttribute type

lte

Less than or equal to operator

# Description

function that builds an opAttribute based on less than or equal to than logic

# Usage

```
lte(x)
## S4 method for signature 'integer'
lte(x)
## S4 method for signature 'numeric'
lte(x)
## S4 method for signature 'Date'
lte(x)
```

### **Arguments**

Х

the value to used as a bound in the op logic. This can either be an integer, numeric, or Date data type. Different data types will return the appropriate opAttribute type

32 male

makeCohortSet

Make a cohort dataframe for cohort generator

### Description

Make a cohort dataframe for cohort generator

### Usage

```
makeCohortSet(...)
```

# **Arguments**

... multiple capr cohorts to bind into a dataframe

#### Value

a tibble containing cohortId, name, sql and json to pipe into CohortGenerator.

male

Add male attribute to a query

### **Description**

Add male attribute to a query Add female attribute to a query

#### Usage

```
male()
female()
```

# Value

An attribute that can be used in a query function An attribute that can be used in a query function

### **Functions**

- male(): male demographic attribute
- female(): female demographic attribute

#### **Examples**

```
# Create a cohort of males with Type 1 diabetes
t1dm <- cs(descendants(201254, 435216, 40484648), name = "type 1 diabetes")
t1dm_males <- cohort(conditionOccurrence(t1dm, male()))
# Create a cohort of males with Type 1 diabetes
t1dm <- cs(descendants(201254, 435216, 40484648), name = "type 1 diabetes")
t1dm_females <- cohort(conditionOccurrence(t1dm, female()))</pre>
```

measurement 33

measurement

Query the measurement domain

# Description

Query the measurement domain

# Usage

```
measurement(conceptSet, ...)
```

# **Arguments**

 ${\tt conceptSet} \qquad \quad A \ measurement \ concept \ set$ 

... optional attributes

#### Value

A Capr Query

measurementType

Add a measurement type attribute to determine the provenance of the record

# Description

Add a measurement type attribute to determine the provenance of the record

# Usage

```
measurementType(ids, connection, vocabularyDatabaseSchema)
```

# **Arguments**

ids the concept ids for the attribute

connection a connection to an OMOP dbms to get vocab info about the concept

vocabularyDatabaseSchema

the database schema for the vocabularies

# Value

An attribute that can be used in a query function

34 nestedAttribute-class

nbt

Not between operator

# Description

function that builds an opAttribute based on not between logic

### Usage

```
nbt(x, y)
## S4 method for signature 'integer'
nbt(x, y)
## S4 method for signature 'numeric'
nbt(x, y)
## S4 method for signature 'Date'
nbt(x, y)
```

### **Arguments**

У

x the left side bound of the between logic This can either be an integer, numeric, or Date data type. Different data types will return the appropriate opAttribute type

the right side bound of the between logic. This can either be an integer, numeric, or Date data type. Different data types will return the appropriate opAttribute type

nestedAttribute-class An S4 class for a nested attribute

# **Description**

An S4 class for a nested attribute

#### **Slots**

```
name the name of the attribute conceptSet a list representing the concepts for the attribute
```

nestedWithAll 35

nestedWithAll	Construct a nested group where all criteria and groups must be satis-
	fied

# Description

Construct a nested group where all criteria and groups must be satisfied

#### Usage

```
nestedWithAll(...)
```

## **Arguments**

... a set of criteria or groups

nestedWithAny

Function to construct a nested group where any criteria and groups may be satisfied

### **Description**

Function to construct a nested group where any criteria and groups may be satisfied

# Usage

```
nestedWithAny(...)
```

### **Arguments**

... a set of criteria or groups

 ${\tt nestedWithAtLeast}$ 

Function to construct a nested group where at least some of the criteria or groups must be satisfied

# **Description**

Function to construct a nested group where at least some of the criteria or groups must be satisfied

# Usage

```
nestedWithAtLeast(x, ...)
```

### **Arguments**

x an integer specifying the number of criteria or groups that must be satisfied... a set of criteria or groups

36 observationExit

nestedWithAtMost

Function to construct a nested group where at most some of the criteria or groups must be satisfied

### **Description**

Function to construct a nested group where at most some of the criteria or groups must be satisfied

### Usage

```
nestedWithAtMost(x, ...)
```

### **Arguments**

x an integer specifying the number of criteria or groups that must be satisfied ... a set of criteria or groups

observation

Query the observation domain

### **Description**

Query the observation domain

#### Usage

```
observation(conceptSet, ...)
```

#### **Arguments**

conceptSet A condition concept set ... optional attributes

### Value

A Capr Query

observationExit

Function to create an exit based on continuous observation

### **Description**

Function to create an exit based on continuous observation

# Usage

```
observationExit()
```

#### Value

an S4 ObservationExit class which defines the cohort exit as the end of continuous observation

ObservationExit-class 37

ObservationExit-class An S4 class for a cohort exit based on end of continuous observation.

# **Description**

The event persists until the end of continuous observation of the persons

#### **Slots**

index specification of event date to offset offsetDays an integer specifying the number of days to offset from the event date

observationType Add a observation type attribute to determine the provenance of the

# Description

Add a observation type attribute to determine the provenance of the record

# Usage

observationType(ids, connection, vocabularyDatabaseSchema)

# **Arguments**

ids the concept ids for the attribute

connection a connection to an OMOP dbms to get vocab info about the concept

vocabularyDatabaseSchema

the database schema for the vocabularies

#### Value

An attribute that can be used in a query function

ObservationWindow-class

An S4 class for an ObservationWindow

# Description

this determines the minimal observation time before and after index for all persons in the cohort

#### **Slots**

priorDays minimum number of days prior to the cohort index postDays minimum number of days post cohort index

Occurrence-class

An S4 class for an occurrence.

# **Description**

This determines how many events need to occur to count the criteria in the cohort definition (relative to the index event)

#### **Slots**

type a character string determine the logic for counting occurrences. Can be all, any, exactly, atLeast, or atMost

count an integer specifying the number of occurrences for a criteria

opAttributeDate-class An S4 class for a op attribute that is a date

#### **Description**

An S4 class for a op attribute that is a date

# **Slots**

```
name the name of the attribute

op the operator one of: gt,lt,gte,lte,eq,bt,!bt

value a value serving as the single limit or lower limit in a bt.

extent a value serving as the upper limit in a bt, otherwise this is empty
```

```
opAttributeInteger-class
```

An S4 class for a op attribute that is an integer

# **Description**

An S4 class for a op attribute that is an integer

# **Slots**

```
name the name of the attribute

op the operator one of: gt,lt,gte,lte,eq,bt,!bt

value a value serving as the single limit or lower limit in a bt.

extent a value serving as the upper limit in a bt, otherwise this is empty
```

```
opAttributeNumeric-class
```

An S4 class for a op attribute that is a numeric

# Description

An S4 class for a op attribute that is a numeric

## **Slots**

```
name the name of the attribute

op the operator one of: gt,lt,gte,lte,eq,bt,!bt

value a value serving as the single limit or lower limit in a bt

extent a value serving as the upper limit in a bt, otherwise this is empty
```

```
opAttributeSuper-class
```

An S4 super class for other opAttribute objects to inherit.

# Description

An S4 super class for other opAttribute objects to inherit.

procedure

Query the procedure domain

# Description

Query the procedure domain

# Usage

```
procedure(conceptSet, ...)
```

# **Arguments**

```
conceptSet A procedure concept set ... optional attributes
```

# Value

A Capr Query

40 Query-class

procedureType	Add a procedure type attribute to determine the provenance of the record
---------------	--

# **Description**

Add a procedure type attribute to determine the provenance of the record

# Usage

```
procedureType(ids, connection, vocabularyDatabaseSchema)
```

# **Arguments**

ids the concept ids for the attribute

connection a connection to an OMOP dbms to get vocab info about the concept

vocabularyDatabaseSchema

the database schema for the vocabularies

# Value

An attribute that can be used in a query function

Query-class	An S4 class for a Circe Query	

# **Description**

A query is a medical concept that can be extracted from a database through a 'where' clause in a 'SQL' statement. This includes concepts.

# **Slots**

```
domain The domain to search (e.g. "Condition", "Drug", "Measurement", etc)
conceptSet The Concept set describing the observation to serach for
attributes a list of attributes that modify the query (e.g. 'male()', 'female()', 'age(gte(65))')
```

rangeHigh 41

rangeHigh

Function to create rangeHigh attribute

# **Description**

This function is used only for measurement query. range\_high is a column in the measurement table of the cdm. This attribute allows a subquery to find measurements that satisfy certain values determined by the op logic.

#### Usage

rangeHigh(op)

#### **Arguments**

ор

an opAttribute object that is either numeric or integer that defines the logical operation used to determine eligible range high

#### Value

An attribute that can be used in a cohort definition

rangeLow

Function to create rangeLow attribute

# Description

This function is used only for measurement query. range\_low is a column in the measurement table of the cdm. This attribute allows a subquery to find measurements that satisfy certain values determined by the op logic.

# Usage

rangeLow(op)

# **Arguments**

ор

an opAttribute object that is either numeric or integer that defines the logical operation used to determine eligible range low

#### Value

An attribute that can be used in a cohort definition

42 startDate

	Camaa	~+C~+
reau	conce	ptSet

Read a concept set json or csv into R

## **Description**

Concept sets can be serialized to json or csv file formats. 'readConceptSet' reads the files into R as Capr concepts sets.

# Usage

```
readConceptSet(path, name, id = NULL)
```

## **Arguments**

path Name of concept set file to read in csv or json format. (e.g. "concepts.json")

name the name of the concept set id the id for the concept set (keep?)

# **Examples**

```
library(Capr)
path <- tempfile("concepts", fileext = ".json")
concepts <- cs(1, 2, descendants(4, 5), exclude(descendants(6, 7)), name = "test")
writeConceptSet(concepts, path = path)
concepts <- readConceptSet(path)</pre>
```

startDate

Function that creates a start date attribute

#### **Description**

Function that creates a start date attribute

#### Usage

```
startDate(op, type = "occurrence")
```

# **Arguments**

op an opAttribute object must be a date that defines the logical operation used to

determine eligible start dates

type specify the type of date to use either occurrence or era. default as occurrence

#### Value

An attribute that can be used in a cohort definition

toCirce 43

toCirce

Function to coerce cohort to circe

# Description

Function to coerce cohort to circe

# Usage

```
toCirce(cd)
```

# **Arguments**

cd

the Capr cohort class

# Value

an s3 list representing the circe object to coerce to json

unit

Add unit attribute to a query

# Description

Add unit attribute to a query

# Usage

unit(x)

# Arguments

Х

A single character idetifier for a unit or a concept set that identifies units

# Value

An attribute that can be used in a query function

# **Examples**

```
# create a unit attribute
unit(8713L)
unit("%")
```

44 visit

valueAsNumber

Function to create valueAsNumber attribute

# **Description**

This function is used only for measurement query. valueAsNumber is a column in the measurement table of the cdm. This attribute allows a subquery to find measurements that satisfy certain values determined by the op logic.

# Usage

```
valueAsNumber(op)
```

# **Arguments**

ор

an opAttribute object that is either numeric or integer that defines the logical operation used to determine eligible patient age

# Value

An attribute that can be used in a cohort definition

visit

Query the visit occurrence domain

# **Description**

Query the visit occurrence domain

# Usage

```
visit(conceptSet, ...)
```

# **Arguments**

```
conceptSet A condition concept set
... optional attributes
```

# Value

A Capr Query

visitType 45

visitType

Add a visit type attribute to determine the provenance of the record

# **Description**

Add a visit type attribute to determine the provenance of the record

# Usage

```
visitType(ids, connection, vocabularyDatabaseSchema)
```

# **Arguments**

ids the concept ids for the attribute

connection a connection to an OMOP dbms to get vocab info about the concept

vocabularyDatabaseSchema

the database schema for the vocabularies

#### Value

An attribute that can be used in a query function

withAll

Function to construct a group where all criteria and groups must be satisfied

# Description

Function to construct a group where all criteria and groups must be satisfied

# Usage

```
withAll(...)
```

## **Arguments**

... a set of criteria or groups

# Value

an S4 group class specifying a bundle of criteria that all must be satisfied in context of the cohort definition

46 withAtLeast

withAny	Function to construct a group where any criteria and groups may be
	satisfied

# **Description**

Function to construct a group where any criteria and groups may be satisfied

# Usage

```
withAny(...)
```

# **Arguments**

.. a set of criteria or groups

# Value

an S4 group class specifying a bundle of criteria that any may be satisfied in context of the cohort definition

withAtLeast

Function to construct a group where at least some of the criteria or groups must be satisfied

# Description

Function to construct a group where at least some of the criteria or groups must be satisfied

# Usage

```
withAtLeast(x, ...)
```

# Arguments

x an integer specifying the number of criteria or groups that must be satisfied... a set of criteria or groups

## Value

an S4 group class specifying a bundle of criteria that at least x be satisfied in context of the cohort definition

withAtMost 47

withAtMost

Function to construct a group where at most some of the criteria or groups must be satisfied

# Description

Function to construct a group where at most some of the criteria or groups must be satisfied

# Usage

```
withAtMost(x, ...)
```

# **Arguments**

x an integer specifying the number of criteria or groups that must be satisfied

... a set of criteria or groups

# Value

an S4 group class specifying a bundle of criteria that at most x be satisfied in context of the cohort definition

writeCohort

Write Cohort json file

# Description

Write Cohort json file

# Usage

```
writeCohort(x, path)
```

# Arguments

x A Capr cohort

path The name of the file to create

# Value

Invisibly returns the path to the json file that was written

48 writeConceptSet

# **Examples**

```
## Not run:
cs1 <- cs(descendants(exclude(436665),440383,442306,4175329), name = "concepts")
# optional step to fill in concept set details. Requires database connection.
con <- {A CDM datbase connection}
cs1 <- getConceptSetDetails(cs1, con)

x <- cohort(conditionOccurrence(cs1))
writeCohort(x, "cohortDefinition.json")

## End(Not run)</pre>
```

writeConceptSet

Save a concept set as a json file

# Description

The resulting concept Set JSON file can be imported into Atlas.

# Usage

```
writeConceptSet(x, path, format = "auto", ...)
```

# **Arguments**

x A Capr concept set created by 'cs()'

path Name of file to write to. (e.g. "concepts.json")

format the file extension to write
... additional arguments

# **Examples**

```
anemia <- cs(descendants(439777,4013073,4013074), name = "anemia")
writeConceptSet(anemia, file.path(tempdir(), 'anemia.json'))
writeConceptSet(anemia, file.path(tempdir(), 'anemia.csv'))</pre>
